

The **City of Roseville Cash for Grass Program's Plant List** contains some of the most common **low and moderate water-use plants** found in the Sacramento region. This list is intended as a tool to Program participants for calculating the 50 percent (50%) living plant coverage requirement for the converted area.

The City of Roseville does not endorse or require the use of any or all plants on this list. Participants may use any living plant to meet the 50 percent coverage requirement for the converted area; however, use of drought-tolerant and low-water-use plants and California species native to this region is highly encouraged.

NOTES AND CODES

Plant Coverage Value

The Plant Coverage Value in square feet is for each plant at its **mature width**; it is the value that will be used by Cash for Grass Program Administrators to determine the canopy coverage regardless of the size of the plant at the time of the inspection.

Shrub Sizes

Shrubs have been grouped into the categories of large, medium, and small based on their **mature height**.

Shrubs - Large	6 - 15 feet tall at maturity
Shrubs - Medium	4 - 6 feet tall at maturity
Shrubs - Small	4 feet or less at maturity

Plant Water Requirements

Plant water requirements were obtained from WUCOLS IV, Water Use Classification of Landscape Species, Fourth Edition, CA Department of Water Resources, Regents of the University of California, California Center for Urban Horticulture, 2014. Sacramento is in Region 2, the Central Valley.

Cultivars, with some exceptions, may not have been included in WUCOLS because it is presumed that many cultivars have the same water requirements as the species.

Water requirements are given for established plants. Consult nursery/landscape professionals, gardening reference books, and/or reliable resources to understand water requirements for specific plant species, the length of time each plant needs to become established, and the amount of water each plant requires. Generally, a plant is established once it has developed substantial roots in the soil adjacent to the root ball. The time of establishment varies among species and based upon soil conditions.

Generally, no supplemental irrigation is required during the rainy season. During unusually dry rainy seasons, supplemental irrigation may be needed. Plant water requirements and frequency of supplemental irrigation can vary depending on specific soil type as well as weather and site conditions.

Water Requirement Codes

VL - Very Low	Plants that require deep, supplemental irrigation once a month during the dry season to those that require no additional irrigation once established and during years of average rainfall in the Sacramento region.
L - Low	Plants that require deep, supplemental irrigation every two to three weeks during the dry season, once established.
M - Moderate	Plants that require deep, supplemental irrigation once a week during the dry season, once established.
WNA	WUCOLS Not Applicable; plant species not listed in WUCOLS. Water Requirement Code based on resources, references, and horticulturalists' experience.

Hydrozones

Hydrozoning is a key component of a water-efficient irrigation system and landscape.

Factors that determine hydrozones include infiltration rate of the soil, soil type, slope, sun exposure, and water needs of the plants. (Infiltration rate is the rate at which water is applied to the soil without causing runoff.)

Hydrozones divide a landscape irrigation system based upon individual plant water requirements, plant height, and planting density.

Select plant species with similar needs and group them within each hydrozone.

Each hydrozone should be served by a valve or control zone separate from others.

Each hydrozone will contain plants that will be irrigated on the same schedule, using the same irrigation method. For example, plant material irrigated by low-volume, multi-stream sprinklers with rotary- or precision-type nozzles will be on a separate schedule and valve from plant material irrigated by low-volume drip emitters.

Solar Exposure

In addition to grouping plants according to their water requirements (hydrozones), plants within each zone should also have the same solar (sun) requirement.

For example: Plants that have low-water-use requirements and prefer full sun should be grouped together and irrigated on the same valve or zone (a valve separate from other zones). Plants with moderate-water-use requirements and prefer part sun would be grouped together and irrigated on the same valve or zone.

Other Codes

CN	California Native
NCN	No Common Name
PA	Protected Area - Plants should be used in protected areas as they may not be frost tolerant in all locations.
NU	Not Used - Plants are not to be used in City maintained landscape areas.
T	Plant or some of its part may be toxic or have irritant properties to humans and/or animals.
*	UC Davis Arboretum All-Stars - Plants recommended for California gardens.
